Weed Detection Workflow

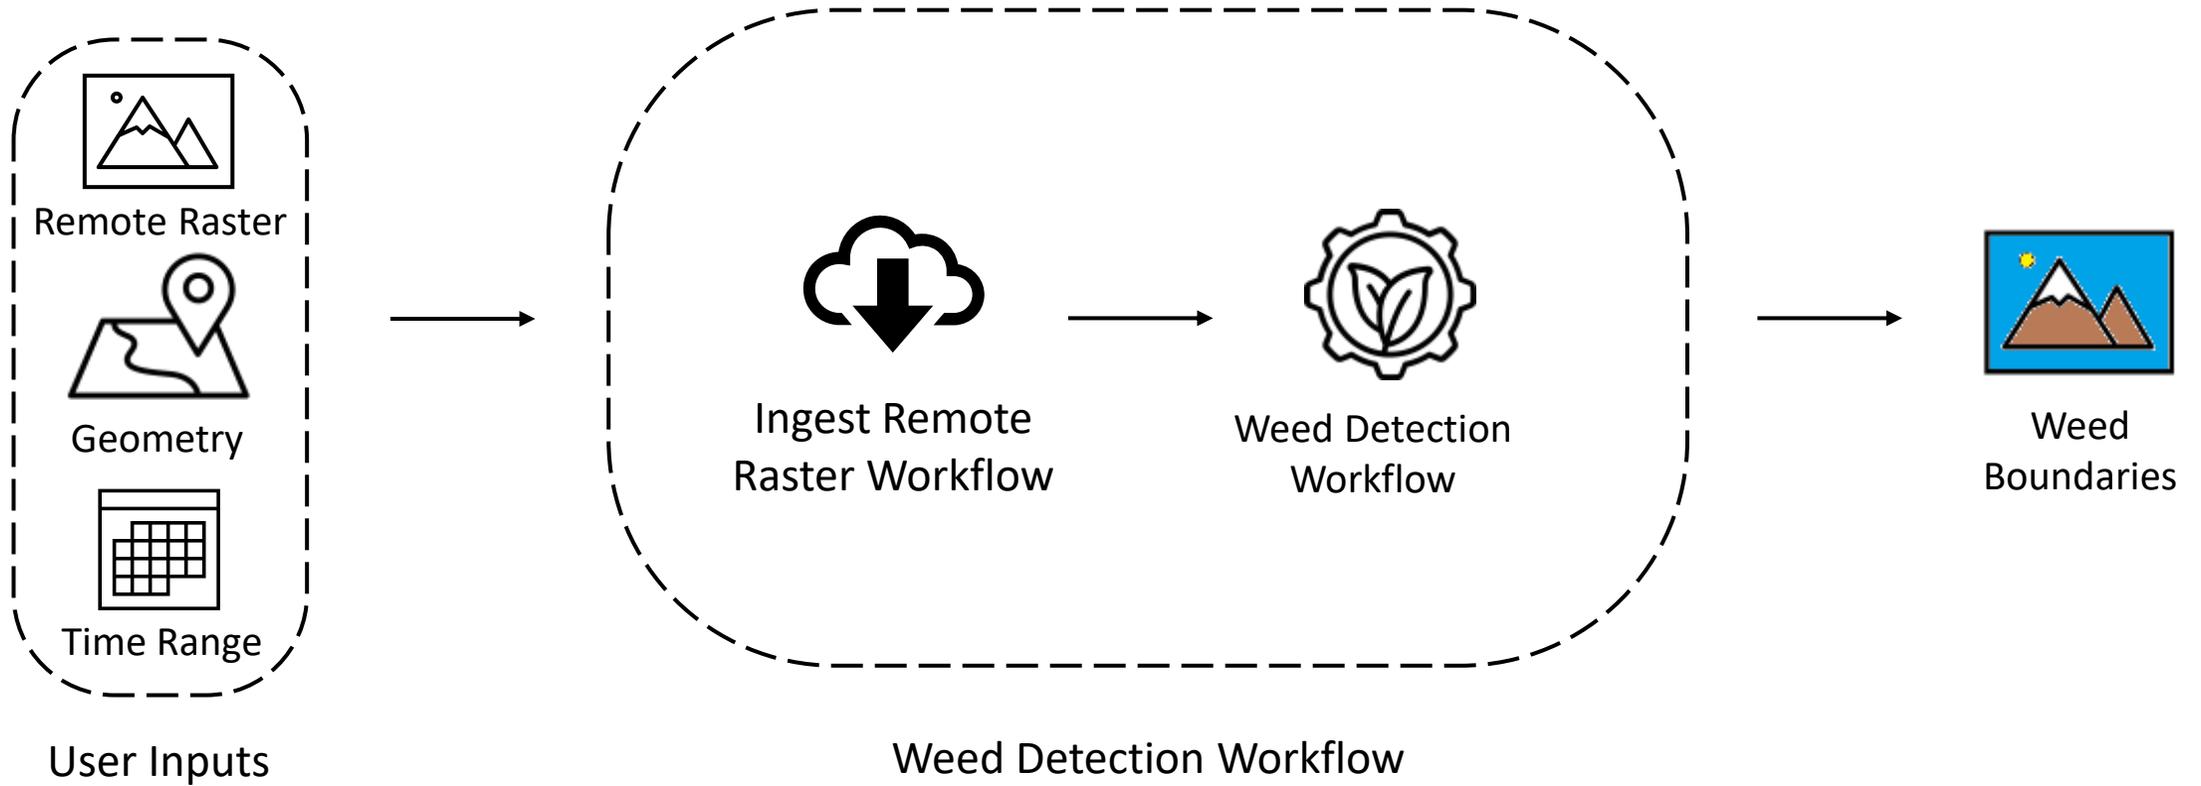

Alex Crown

Microsoft Research

Outline

- Weed detection workflow overview
- Creating raster images
- Storing data in Azure
- Running the workflow
- Analyzing results

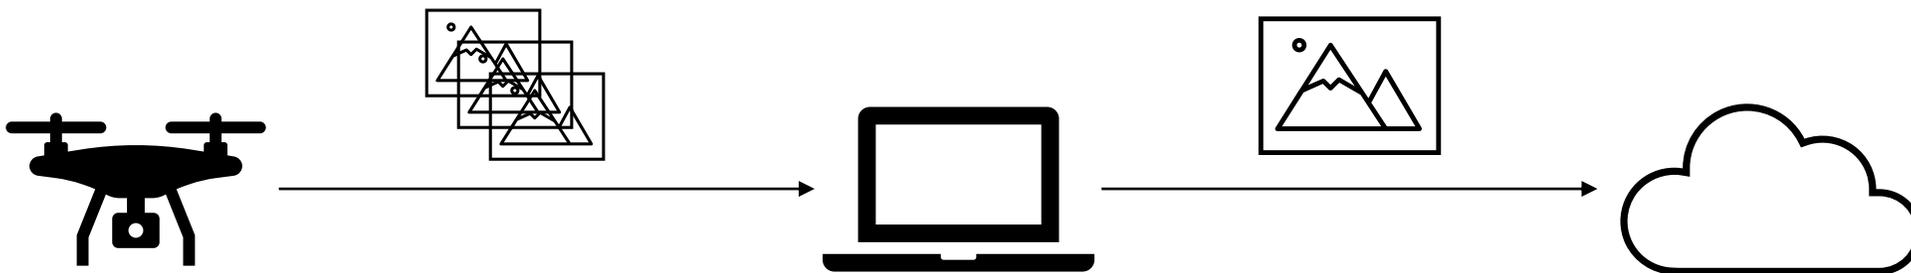

Workflow Summary

Creating a raster image

- Drone imagery is the best fit for this workflow
- Stitched images
 - Third party software (e.g., Pix4D)
 - FarmVibes.Edge (including project Visage)
 - [Visage: Enabling Timely Analytics for Drone Imagery - Microsoft Research](#)

Creating raster images with FarmVibes.Edge

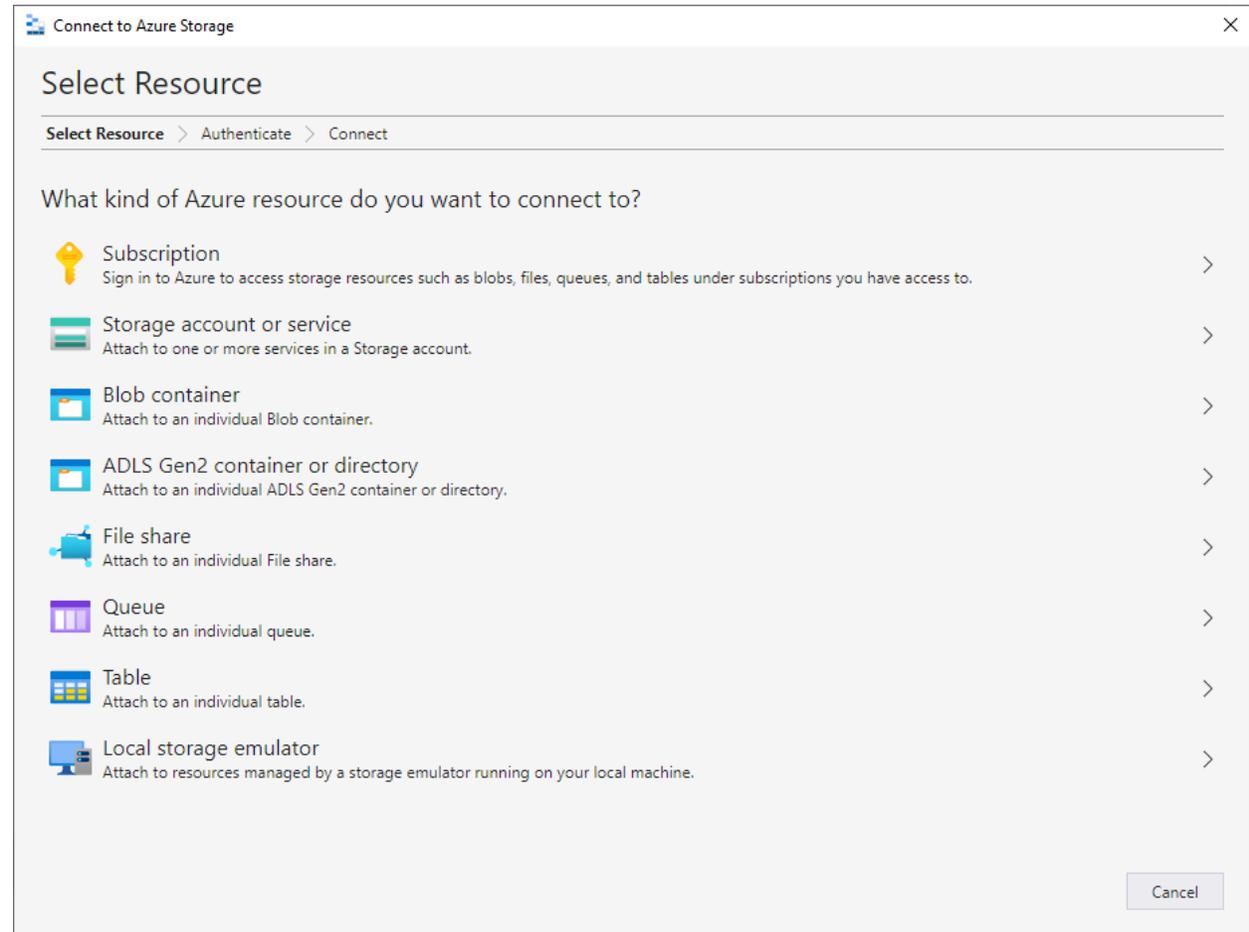

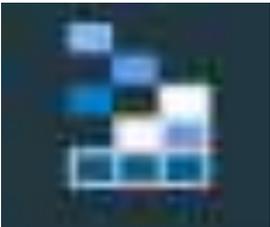

Using Azure Storage

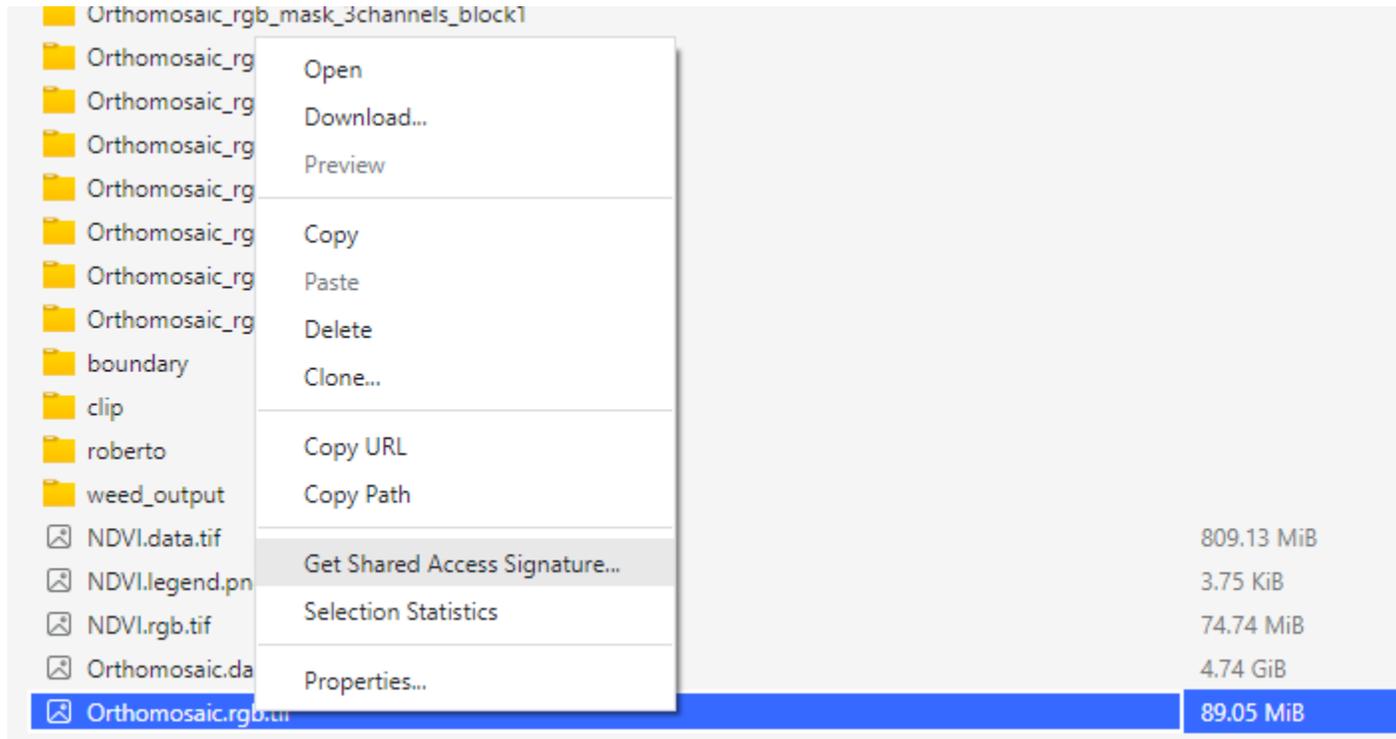

- File Storage
- Blob Storage
- Read images with signed URL
 - [SAS Tokens](#)

Using Azure Storage

- Azure Storage Explorer

Creating SAS Tokens

Inputs

Required

- Geometry
- Time Range
- Signed URL to Raster

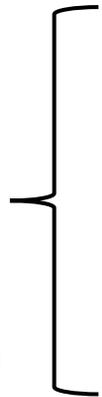

Output

- Zip archive containing a shapefile for each cluster

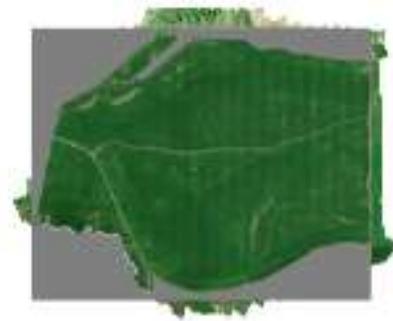

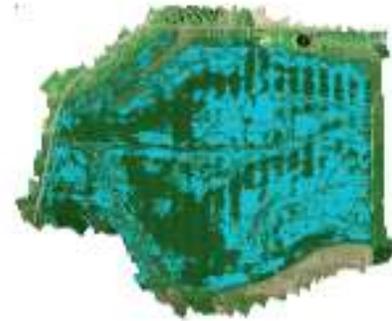

result.zip

cluster_0.shp
cluster_1.shp

...

Inputs

Optional

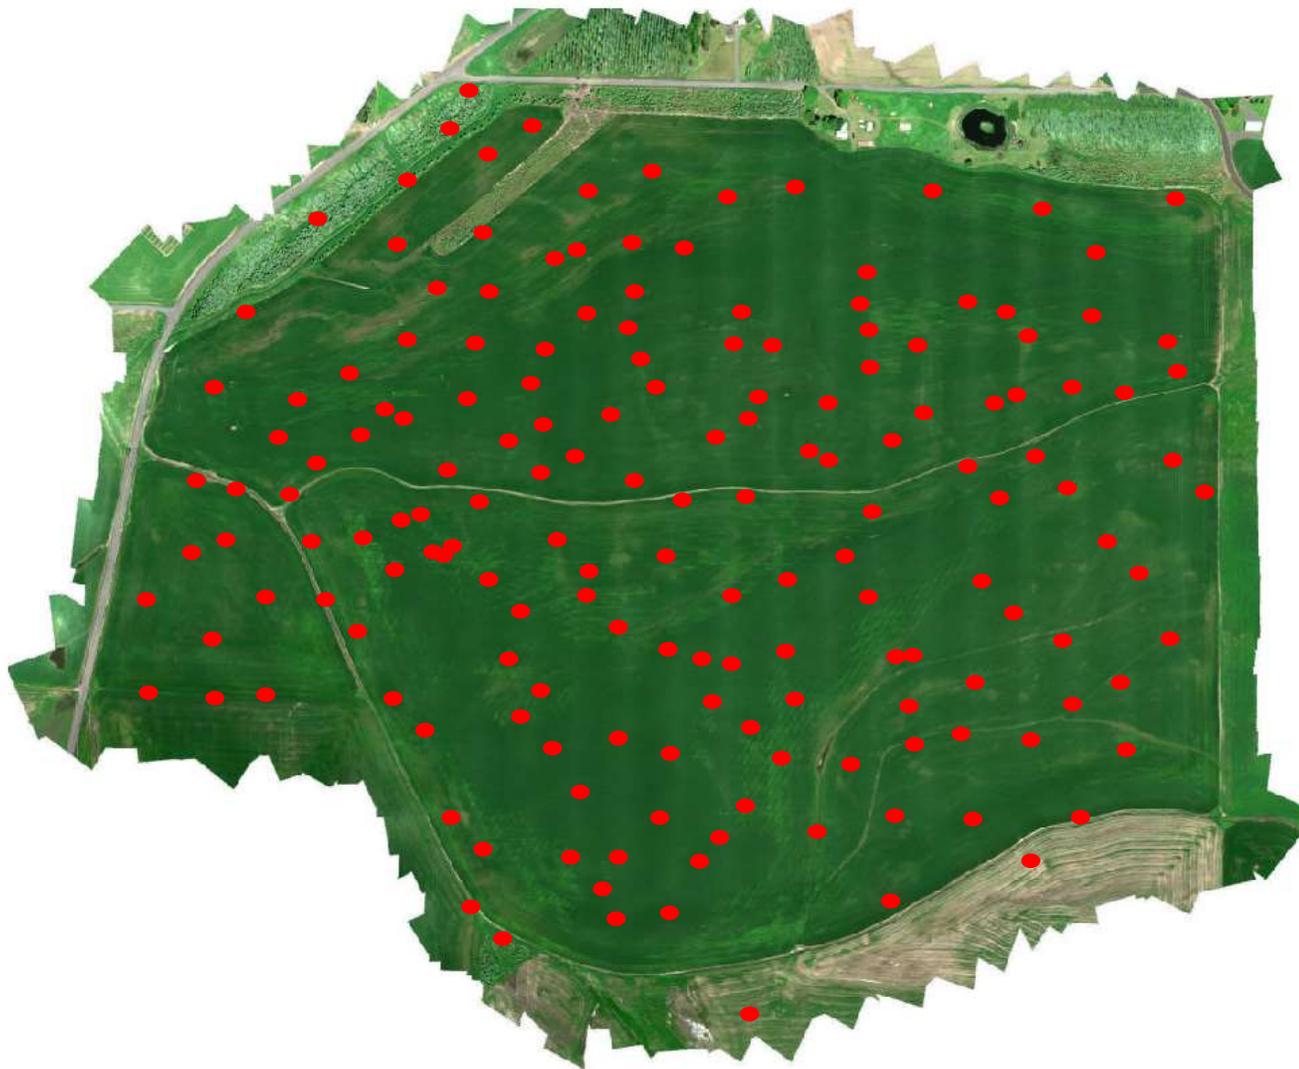

- Samples
- Buffer
- Grid Size
- Clusters
- Sieve Size
- Simplify
- Tolerance

Inputs

Optional

- **Samples**
- Buffer
- Grid Size
- Clusters
- Sieve Size
- Simplify
- Tolerance

- Simplify
- **Tolerance**

Low Tolerance

High Tolerance

Running the Workflow

Notebook:

[farmvibes-ai/notebooks at main · microsoft/farmvibes-ai \(github.com\)](https://github.com/microsoft/farmvibes-ai/tree/main/notebooks)

Running the Workflow

Install dependencies

```
$ cd notebooks/weed_detection/  
$ conda env create -f ./weed_detection.yaml  
$ conda activate weed_detection
```

Running the Workflow

Create a client

```
import geopandas as gpd
from vibe_core.client import get_default_vibe_client
from vibe_core.data import ExternalReferenceList
from datetime import datetime
from shapely import geometry as shpg
from urllib import request

client = get_default_vibe_client()
```

Running the Workflow

Generate the input

```
url = "https://demostorage.file.core.windows.net/demofield/WeedImages/weed  
boundary_shape_file = "demo_field/boundary.shp"  
  
now = datetime.now()  
data_frame = gpd.read_file(boundary_shape_file).to_crs("epsg:4326")  
assert data_frame is not None  
geometry = shpg.mapping(data_frame.geometry.iloc[0])  
url_hash = str(hash(url))  
  
inputs = ExternalReferenceList(id=url_hash, time_range=(now, now),  
                               geometry=geometry, assets=[], urls=[url])
```

Running the Workflow

Start the workflow

```
run = client.run(workflow='farm_ai/agriculture/weed_detection',  
                 name="weed_detection_example", input_data=inputs)
```

```
params = {"clusters": 5, "simplify": "none"}  
run = client.run(workflow='farm_ai/agriculture/weed_detection',  
                 name="weed_detection_example", input_data=inputs,  
                 parameters=params)
```

Running the Workflow

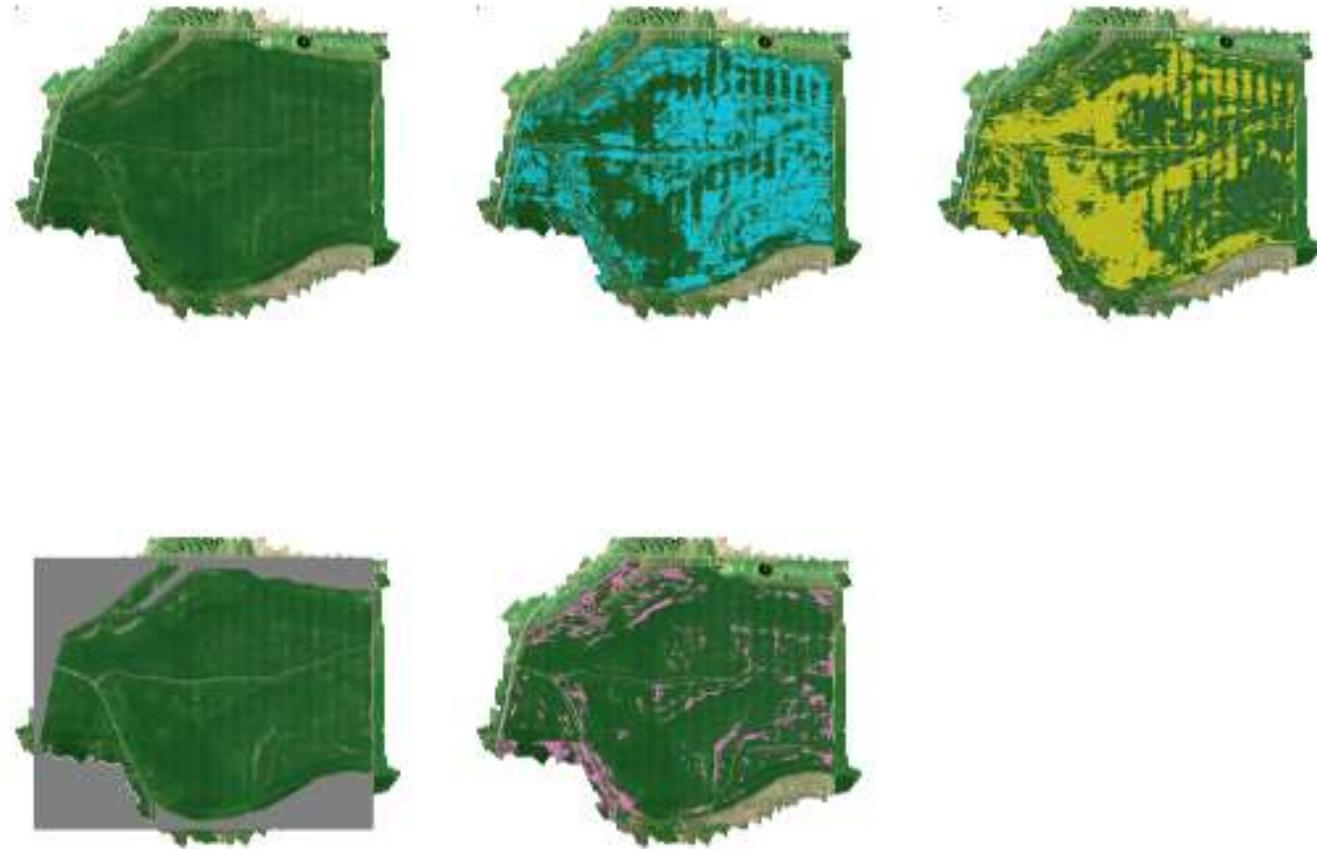

Get the results

```
run.monitor()  
# Output is a DataVibeDict  
output = run.output  
# There was only one input raster to the weed detection workflow so there is only one DataVibe in the result  
dv = output['result'][0]  
# The DataVibe output by a weed detection workflow instance has only one asset  
asset = dv.assets[0]  
# Get the asset path containing the generated shape files  
archive_path = asset.path_or_url  
print(archive_path)
```

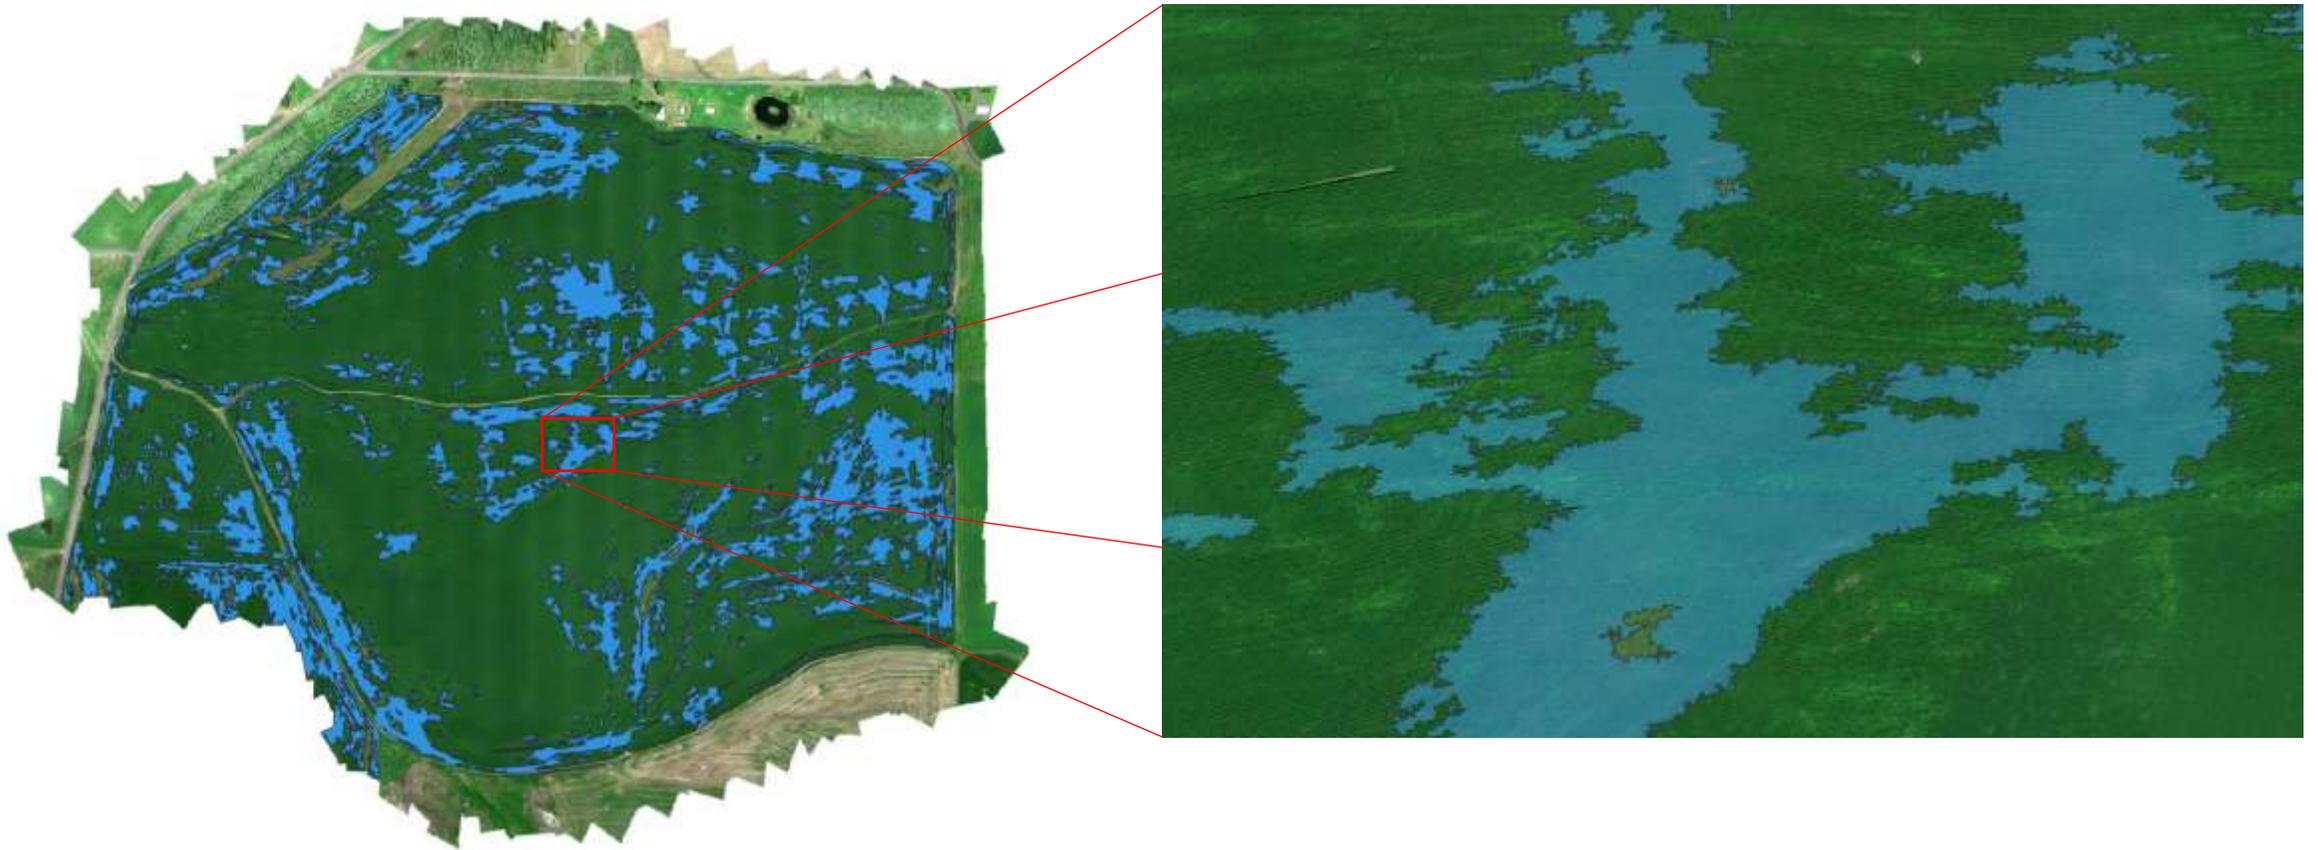

Visualizing Results
